SEWING A SHOE

Sewing a shoe is a shoe repair skill that involves the use of a needle to join parts together into a shoe. For one to sew a shoe, he needs the following tools:

i. Shoe thread
ii. Shoe needle

To begin sewing, one should pierce with the needle through the parts to be joined, thereafter the thread should be hooked on the needle, and then the needle should be drawn down carrying the thread.

Now the thread has passed through the parts to be joined, so you can begin the sewing proper by passing the needle through the materials again but in another point, hook the upper part of the thread on the needle and then draw it down skilfully such that it forms a sort of loop on the other side, then you can pass the down part of the thread through the loop and then draw the upper part of the thread so that the sewing can be tight. Continue like this until where you wish to end then tie both the upper and down parts of the thread and then cut. Now your shoe has be successfully sewn.
