COMPUTER REPAIR WORKSHOP

A computer repair workshop is the special place for a computer technician to carry out his computer hardware skills. It is the place wherein computer maintenance and assemblages are done.

A basic computer workshop has to have a good wiring and voltage supply. Thus, it ought to be properly planned before construction and usage. Special electrical equipment is very necessary. For example, a standby generator, an

inverter, voltage regulators, batteries, etc. Lighting and cooling systems are very essential so to enable night work and the cooling of heat generated from the electrical fixtures/equipment respectively. Work tables or desks are very much needed to carry any computer device/peripheral that is worked on. Shelf is also needed to hold the needed literatures, or better still, a dedicated electronic reader or tablet with e-books installed in it. Cupboard is also needed to hold tools and materials. Also the cupboard should be properly labelled so to make the finding of tools and materials easy.
